## Creating and editing hosts

- 1 Creating and editing hosts in the Setup menu
- 2 The host name
- 3 Alias and IP address
- 4 Monitoring agents
- 5 Custom attributes
- 6 Saving and continuing

To manage folders and hosts, go to Setup > Hosts > Hosts:

**Main**  
Setup > Hosts > Main  
No pending changes

Hosts Folder Related Display Help Filter

## Which hosts do you want to monitor?

Command Line Download &amp; Install

Server (Windows, Linux)

Websites

AWS (Amazon Web Services)

Azure

GCP (Google Cloud Platform)

Network Devices and SNMP

Virtualization platforms, Kubernetes, and storage solutions

## Websites

1

### Create a host

In this step the `www.checkmk.com` website is created as host:

1. Click **Setup** > **Hosts** > **Hosts** to open the **Main** folder page and then click **Add host**.
2. Set **Host name** to `www.checkmk.com`.
3. In the **Monitoring agents** box, set **Checkmk agent / API integrations** to **No API integrations, no Checkmk agent**.
4. In the **Custom attributes** box, check **Labels**, click **Add some label** and enter `webprotocol:https`.
5. Click **Save & view folder**.

You can add more web servers in the same way by simply applying the special host label to them.

Next: Configure the active check

Select the Checkmk agent package

DEB

RPM

MSI

2

Trigger download of the Checkmk agent package

Run this command to trigger the download of the Checkmk agent onto your workstation that is automatically registered with your Checkmk site.

```
(  
curl -o check-mk-agent.deb \  
--header 'Accept: application/octet-stream'  
--header 'Authorization: Bearer agent_download <secret>' \  
"https://<server name>/<site name>/check_mk/api/1.0/domain-types/agent/actions/download_by_host/invoke?  
folder_name=%2Fpreconfigured_agent%2F&os_type=linux_deb&agent_type=generic"  
);  
history -d $(history 1)
```

Copy

*Note: The above command contains the credentials for a site user with limited permissions. The user's password is rotated regularly.*

3

Install the Checkmk agent package
